# Current Practice

# Proposed Approach

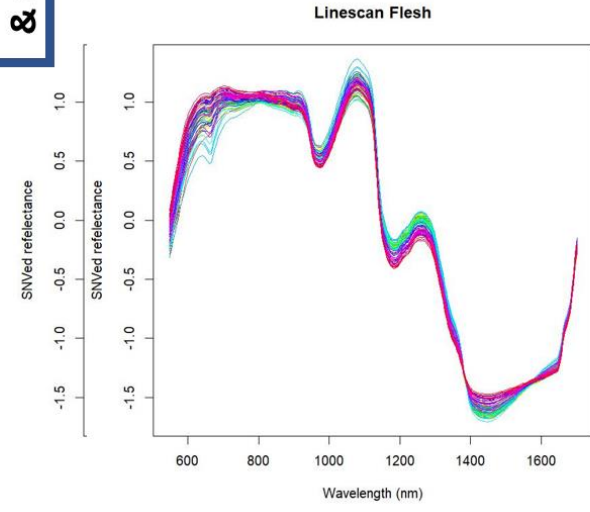

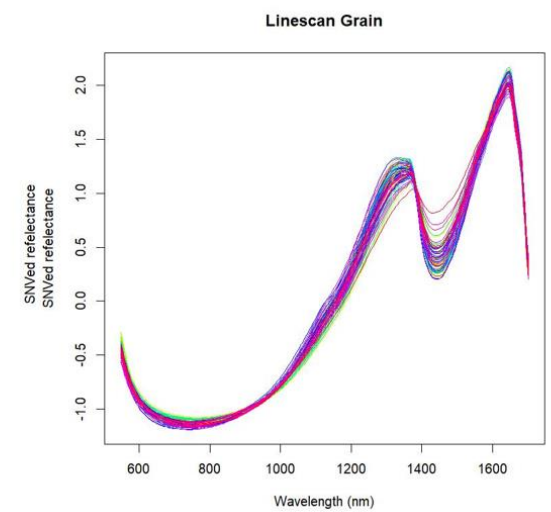

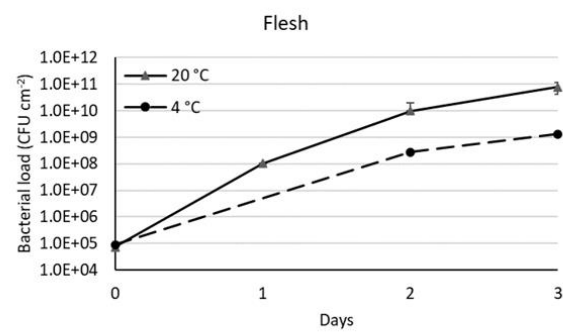

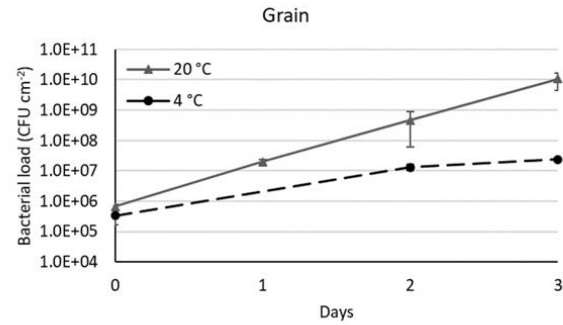

Staling of bovine hide

**Microbiological examination**

**HSI**

**Leather quality**

**Prediction & Grading**

# Swab Sampling of Raw Materials

# Aerobic Plate Count

Calculation: Number of colonies on plate  $\times$  reciprocal of dilution of sample = number of bacteria/ml  
 (For example, if 32 colonies are on a plate of  $1/10,000$  dilution, then the count is  $32 \times 10,000 = 320,000$  bacteria/ml in sample.)

# Bacterial Load vs Grain Quality

Figure 1 Aerobic plate counts for grain and flesh sides of hide samples.

Figure 2 Representative microscopic images of grain surfaces. Scale bar, 0.5 mm
